

Manger Liner

Installation Instructions

Please install plastic at 65-70 degrees for best installation.

Roll out the manger liner in feed bunk and flip over with the natural curl up. The weight of the feed will cause plastic to flatten. Attach at one end with fasteners every 4" staggered. Then put a fastener at manger side at about 1 foot and then again at 2'. Do not place any other fasteners the length of the plastic to prevent buckling. This plastic will expand and contract.

Molding for the Feed Alley edge are available at extra cost, but they have been proven unnecessary for most installations.

If you have any further questions please feel free to call.
